5-Day Online Hands-on Workshop (MDP)  
on

# Artificial Intelligence & Machine Learning for Business Decision-Making

**Schedule**

**25<sup>th</sup> to 29<sup>th</sup> May 2026**

**6:00 PM - 9:00 PM (Online)**

## Introduction:

Artificial Intelligence (AI) and Machine Learning (ML) are transforming how organizations make strategic, tactical, and operational decisions. From customer acquisition and retention to risk management, demand forecasting, and personalization, AI/ML-driven analytics enables data-backed, explainable, and scalable business decisions.

This 5-Day Hands-on Workshop (MDP) on AI & Machine Learning for Business Decision-Making is designed to bridge the gap between ML techniques and managerial decision-making. The programme emphasizes business-oriented use cases, hands-on demonstrations, and interpretation of model outputs for executives and managers, rather than treating ML as a purely technical subject.

The MDP uses practical datasets, visualization-driven explanations, and an easy-to-use analytics interface (SADSA) to make AI/ML accessible to faculty from Management, Commerce, Economics, Computer Applications, and Engineering disciplines.

## Programme Description:

The MDP provides a structured and application-driven overview of supervised learning, unsupervised learning, recommender systems, and ensemble models, with a strong focus on how these techniques support real-world business decisions. Each ML technique is mapped to specific managerial questions, such as:

- Which customers are likely to churn ?
- How should customers be segmented for targeted marketing ?
- Which products should be bundled or recommended ?
- How can business risk and fraud be detected early ?

Participants will gain both conceptual clarity and hands-on exposure to AI/ML workflows, model evaluation, and result interpretation for business contexts.

## Programme Objectives

1. Develop conceptual understanding of AI and ML techniques relevant to business decision-making.
2. Enable participants to map business problems to appropriate ML models.
3. Provide hands-on experience with supervised, unsupervised, and ensemble learning techniques.
4. Train participants to interpret ML outputs for managerial and executive audiences.
5. Support faculty in designing AI/ML-enabled case studies, labs, and student projects.

## Programme Contents (Day-wise):

| Day | Content Coverage                                                                                                          | Business Demo Exercises                                                                                                                                    |
|-----|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I   | Supervised Learning Foundations (Logistic Regression; Decision Trees; Random Forests)                                     | Customer churn prediction; Creditworthiness classification, Supplier risk classification; Predicting order fulfillment delays.                             |
| II  | Classification & Similarity-Based Models (Naive Bayes; KNN; SVM; Neural Networks)                                         | Sentiment classification of customer reviews; Fraud vs non-fraud transaction classification - Risk category classification; Quality defect classification. |
| III | Clustering, Dimensionality Reduction & Pattern Discovery (K-Means; Hierarchical Clustering; DBSCAN; PCA; Factor Analysis) | Customer segmentation; Brand positioning using dendrograms; Workforce segmentation based on performance & engagement; Anomalous transaction detection.     |
| IV  | Association Rules & Recommender Systems (Association Rule Mining; Content-based & Collaborative Recommender Systems)      | Market basket analysis; Cross-selling rules; Credit card offer recommendations, Inventory bundling; Spare parts recommendation                             |
| V   | Ensemble Learning & Business Model Robustness (Boosting; Bagging, Stacking)                                               | Campaign response prediction using ensemble models; Stress testing; Demand forecasting improvement using ensembles.                                        |

### Programme Fee : ₹ 3540/-

Fees Includes: GST 18%, MDP participation, hands-on sessions, learning materials, and e-certificate.

### Programme Outcomes:

Upon successful completion of the MDP, participants will be able to:

- Apply AI/ML techniques to real-world business decision problems.
- Interpret classification, clustering, and recommendation model outputs for managerial use.
- Select appropriate ML models based on business objectives and constraints.
- Design AI/ML-based case studies, lab exercises, and student projects.
- Communicate AI-driven insights effectively to non-technical stakeholders.

## About SADSA (Statistical Application for Data Science & Analytics):

**SADSA** is an integrated, free analytics application designed to simplify data analysis, machine learning, and report generation for teaching, research, and business analytics. It provides menu-driven access to statistical techniques, ML models, visualizations, and automated reporting features using GenAI.

### Key highlights:

- User-friendly interface for ML and analytics.
- Supports supervised, unsupervised, and ensemble techniques.
- Visualization-driven interpretation.
- Suitable for classroom teaching, MDPs, FDPs and student projects.

SADSA enables faculty and learners to focus on analysis and interpretation, rather than extensive programming. For more information visit : <https://github.com/codingfigs/SADSA-ULTIMATE/releases/>

### About the Resource Person:

**Dr. M. Kamakshaiah** is an academician, researcher, and trainer with extensive experience in Business Analytics, Data Science, AI/ML applications, and research methodologies. He has designed and delivered multiple MDPs, workshops, and academic programmes on analytics, AI, and decision sciences.

His areas of expertise include:

- Business Analytics & AI for management
- Machine Learning and data-driven decision-making
- Research methods, scale development, and SEM
- Applied analytics using open-source tools

**Dr. Kamakshaiah Musunuru**  
LinkedIn

He actively works on developing practice-oriented analytics tools and curricula that bridge the gap between theory, research, and industry needs.
